Introduction

This report provides some feedback about the ability tests which you recently completed.

The tests that you completed provide a fair and objective assessment of your cognitive ability. Research has shown that these tests can provide reliable information concerning future performance in many different jobs. However, many other factors also play an important role in predicting job success.

You may have already received personal feedback on these results, or had this offered to you. Whoever gave you feedback and/or this report should be qualified to answer your queries about any aspect of the report.

This report is confidential and is intended for your personal use only. Please note that test results remain valid for about 12 to 18 months.

The ability tests

In order to gain a full understanding of the meaning of your scores on the ability tests, your performance has been compared to that of a large group of individuals who have taken these tests in the past. This is known as a comparison group.

The tests that you completed include:

The deductive reasoning test

This test is designed to measure the ability to draw logical conclusions based on information provided, identify strengths and weaknesses of arguments, and complete scenarios using incomplete information.

The inductive reasoning test

This test measures the ability to work with incomplete information and create solutions to novel problems from first principles. People who perform well on this test will have a greater capacity to think conceptually as well as analytically.

The numerical reasoning test

This test measures the ability to make correct decisions or inferences from numerical data. The data presented and the tasks set are relevant to a business environment. The emphasis in these tasks is on understanding and evaluating data rather than on computation. People who perform well on this test tend to have the capacity to understand numerical data and interpret mathematical information correctly.

Results

Deductive Reasoning

Percentile compared to the Interactive G+ General Composite (INT) v1 comparison group

Grade **D**

Your performance on this test indicates that your deductive reasoning ability is **below average** when compared to the comparison group. This suggests that using sound logic to solve problems, strengthening arguments, and identifying weaknesses in the propositions of others is unlikely to be a strength for you.

Ideas to help improve your skills

As this skill area is unlikely to be a strength for you, you may be interested in things you can do to help improve these skills.

Developing your skills is something that requires considerable time and effort. As well as reviewing the practical tips below, think about the opportunities you have in your everyday life to challenge yourself in this skill area. How can you gain more exposure to this type of information?

- When you are debating with a friend or colleague, discuss why and how he/she came to his/her conclusions. The strength of an argument hinges upon whether a conclusion necessarily follows from the evidence.
- Many arguments leave steps out and assume that the reader or listener will fill in the blanks. Identifying and challenging these assumptions is one of the best ways to defeat an argument.
- When making arguments and drawing conclusions, always ask yourself if your conclusion **MUST** follow based on the evidence you have available. If not, determine what additional evidence is required or how your conclusion needs to be adjusted.
- If you implement a solution to a problem and it fails, reflect on your problem solving process to see if steps were left out, information was missing, or your logic was flawed.
- Read editorials in respected newspapers and identify the evidence, assumptions, and conclusions in the arguments. Think of ways that you could challenge the conclusions made by the writer.

Inductive Reasoning

Percentile compared to the Interactive G+ General Composite (INT) v1 comparison group

Grade **B**

Your performance on this test indicates that your inductive reasoning ability is **above average** when compared to the comparison group. This suggests that understanding incomplete information and solving novel problems by creating solutions from first principles is likely to be a strength for you.

Ideas to help improve your skills

Although this skill area is likely to be a strength for you, you may be interested in things you can do to continue to improve these skills.

Developing your skills is something that requires considerable time and effort. As well as reviewing the practical tips below, think about the opportunities you have in your everyday life to challenge yourself in this skill area. How often do you have to create solutions from first principles? To what extent are you commonly faced with new and incomplete information? How can you gain more exposure to this type of information?

- Complete timed problem solving exercises and puzzles in newspapers and puzzle books.
- Practice developing a few well-thought out solutions to issues at home and at work, even if a solution already exists.
- Before you make a decision, stop and think about whether you have sufficient information to make a logical rather than intuitive decision.
- Don't always go with your first decision - force yourself to think of other alternatives before proceeding.
- Learn how to skim documents quickly to extract the key information.

Numerical Reasoning

Percentile compared to the Interactive G+ General Composite (INT) v1 comparison group

Grade **A**

Your performance on this test indicates that your numerical reasoning ability is **well above average** when compared to the comparison group. This suggests that understanding or interpreting numerical data and mathematical calculations is highly likely to be a strength for you.

Ideas to help improve your skills

Although this skill area is very likely to be a strength for you, you may be interested in things you can do maintain or enhance these skills.

Developing your skills is something that requires considerable time and effort. As well as reviewing the practical tips below, think about the opportunities you have in your everyday life to challenge yourself in this skill area. How often do you deal with numerical data and mathematical calculations? How can you gain more exposure to this type of information?

- When you encounter situations at work or at home that require math, use a paper and pencil to solve the problem. Do all calculations by hand when possible and check your answers using a calculator.
- Practice converting real-life situations that require math into equations on paper. This will help you identify all the variables in a problem, solve the problems by hand, and learn how to apply your knowledge to similar problems you encounter in the future.
- Understand the relationship among decimals, fractions, and percentages and how to convert from one to the other.
- Learn how to evaluate and interpret charts and graphs and consider alternative ways that the data could be presented.
- Determine how to use all the basic, intermediate, and advanced functions on your calculator and any mathematical functions of spreadsheet software that you use.
